

**METHOD AND SYSTEM FOR ELECTRONICALLY ROUTING
AND PROCESSING INFORMATION**

Abstract of the Disclosure

A method and system for routing and processing insurance related data. A data entry operator that receives insurance application-related documents from external sources. The data entry operator stores the documents electronically in a raw data database. A rules engine converts the documents into at least one data element having a common format. The rules engine then determines whether each of the at least one data element has been fully validated as clean data. If the data is verified, the clean data is stored in an operational database for use in application processing.. If a data element is not clean, the rules engine generates an exception task. The rules engine then receives a resolution to the exception task, thereby enabling validation of the at least one data element.
